

BrightWall

BEFORE

The unsightly, damp walls of a typical basement make for an uncomfortable living space.

AFTER

The BrightWall® Panel System cleans-up an area that was otherwise unusable and creates an attractive, dry living space.

The BrightWall® Paneling System is 4' x 8' sheets of plastic paneling attached to the walls with special drilled-in fasteners that will never come off. BrightWall® provides a clean, bright, semi-finished look to your basement walls while stopping water vapor from permeating, and draining any leaks down to a water management system. It looks great and is the most durable of our wall system options.

This is an example of a BrightWall® Panel System being installed on a block wall, brightening-up the basement and making the living space look larger.

BrightWall

PANELING SYSTEM

AFTER

BEFORE

BrightWall® Paneling brightens your basement and gives it that clean, semi-finished touch.

Unfinished concrete walls are cold, damp, and uninviting.

A complete floor-to-ceiling installation of our BrightWall® waterproof panels give you a clean, bright and dry living area.

AFTER

The **BrightWall**® System with **BrightPost**® padded column wrap on 2 posts. **BrightPost**® on columns is an attractive addition to a **BrightWall**® panel job.

Cross section of **BrightPost**® padded column wrap.

BEFORE

An ineffective, open sump pump pit and a damp, unusable basement are common homeowner complaints.

Airtight lid keeps out moisture, odors, bugs, radon gas and quiets the pump.

AFTER

A **BrightWall**® System, **WaterGuard**® Waterproofing System with a **TripleSafe**® Sump Pump (with completely enclosed with air-tight lid), and **SaniDry**™ XP Basement Air System turn a dangerous, unusable basement into a clean, safe, comfortable area for you and your family to enjoy.

The Many Benefits of the **BrightWall**® Panel System.

Basement walls are commonly damp, discolored, and dirty. Coating them with any paints or sealers is not the solution as any permeating moisture will push coatings off. In many cases, walls look worse with peeling, flaky, failed coatings on them - but what are your options? **BrightWall**® is the answer!

BrightWall® panels are semi-rigid, waterproof plastic panels that fasten mechanically to the walls. Unlike a coating, they can never be pushed

off by moisture coming through the wall. This is because they are installed with special fasteners that are anchored into the concrete wall, so there is no adhesive bond to rely on.

Because **BrightWall**® panels are 100% waterproof, they will never rot, warp, or discolor. Any water passing through the wall from wall cracks, or other penetrations, will run behind the panel down to the waterproofing system below.

Efflorescence from the concrete (*chalky, white stuff on basement walls*) will not affect the panels and be encapsulated behind them. Stored items such as cardboard boxes, or basement finishings, can be in contact with the **BrightWall**® panels without the worrying if they will ever get wet.

Because **BrightWall**® panels are decorative, they will dramatically improve the appearance of the basement. They are clean and bright and will make the basement a lot brighter with the available lighting. **BrightWall**® panels

are washable, just like a kitchen countertop! **BrightWall**® panels look so good that many installations have been made just to improve the appearance of the walls in basements that did not have water seepage problems.

See the book 'Dry Basement Science' for complete information on making your basement dry, usable space!
