After

Your basement leaking is bad enough - but when your basement is finished it's much worse! The bottom of your finished walls are damaged, mold may appear, and rot begins. ***Not a good situation.*** When you don't want to rip out your entire basement, and have to restore the bottom of your walls anyway, the EverLast Finished Wall Restoration System is a perfect solution!*

Powered By:

Drywall or Wood + Moisture = MOLD **BAD!**

The enemy of finished basements is mold. Your wet, damaged drywall basement walls can be a breeding ground for mold and odors. It's what causes that musty smell in basements, and causes discoloration and rot of building materials. Drywall and wood are particularly vulnerable. This is why basements finished with conventional materials will have to be redone at some point when the owner can't stand the smell and deterioration anymore. Besides concerns over a

groundwater leak, plumbing leaks will happen - it's not a matter of if you will have water in your basement one day - it's when.

The EverLast Finished Wall Restoration System uses only mold-resistant materials - with no vulnerable organic material. The EverLast Finished wall panels and trim are not prone to damage like drywall, wood moldings, fabrics, wood-based flooring, and wood framing. In fact, a basement refinished with the EverLast Panels can temporarily flood from a plumbing leak, inches deep, and it is highly unlikely that walls or trim will need to be replaced!

Mold can penetrate porous drywall, creating a very unhealthy living space.

SAVING YOUR FINISHED BASEMENT - AND MONEY!

Your finished walls are water damaged - but it's just the bottom of the walls. It would be a shame to rip out the entire basement.

Wouldn't it be much cheaper and less disruptive to replace just the damaged part?

That's what the EverLast Finished Wall Restoration System does for you!

RESTORE THE BOTTOM OF YOUR FINISHED WALLS - WITHOUT RIPPING THE ENTIRE BASEMENT OUT AND STARTING OVER!

In order to fix the water problem properly, and protect finished walls in the future, it is necessary to cut the bottom of your finished walls and install a proper drainage system such as the WaterGuard® System. Then your basement is protected from future destructive leakage. But what then? Your finished walls need to be restored.

The EverLast Finished Wall Restoration System is a perfect solution. With this method, your entire basement wall doesn't have to be replaced. There is no drywall, paint, or wood to get ruined if it ever gets wet. Instead, the panels are cement board, covered with a textured washable vinyl finish, and the trim is all plastic, all installed over metal studs — Nothing for mold to grow on!

This is important because even after your water leakage problem is fixed, you still need to dehumidify properly, and most importantly, plumbing leaks are bound to happen. When a plumbing leak happens resulting in inches of water, your new EverLast Walls will not be affected at all!

The perfect finish on EverLast Panels - The EverLast Panels combine the two most popular interior finish colors - off white and beige - laid in a designer pattern over a slightly alligatored vinyl. It looks great, matches any interior decor, and expertly hides wall marks and shine - and it's washable and never needs paint. There's a 50 Year Warranty* on the EverLast Walls - What could be better than that?

WaterGuard® BASEMENT WATERPROOFING SYSTEM

When your basement leaks, you need a perimeter drainage system - and our WaterGuard system is the best. But, the drainage system must be installed behind your finished walls to protect them.

By using the EverLast Finished Wall Restoration System you are not only replacing the damaged part of your finished walls and saving the rest, but you are able to install the WaterGuard drainage system where it needs to be to protect your finished walls from getting wet.

THIS IS WHAT WE DO:

1. Damaged basement walls.

2. Cut and remove the damaged drywall and bottom of the studs.

3. With the bottom of the finished wall removed a perimeter drainage system can be installed where it needs to be - against the foundation wall.

4. Replace the bottom of the wood studs with metal studs.

5. Install EverLast Wall Panels up to 32", finish with chair rail and trim. Install optional ThermalDry or Millcreek Flooring.

* See warranty for full details. This system is not a complete mold remediation strategy, and the contractor makes no warranty about the presence of mold, or mold spores before, or after this work anywhere in the home.

Recommended Options

ThermalDry® Flooring

ThermalDry® Flooring is a perfect solution for the floor because it is raised off the cold, hard, damp concrete floor. It won't be damaged by a plumbing leak, and is modular, so you can replace a damaged spot without replacing the entire floor. ThermalDry® Flooring is a great option with the EverLast Wall Restoration System. The ThermalDry® Basement Floor Matting System will turn your cold, damp, hard concrete floor into a dry, comfortable floor. You have the choice of carpeted, or vinyl tile finishes. If you have had your carpet or flooring ruined by water before, and it got moldy and needed to be replaced, ThermalDry® Flooring is your answer. An air space under the floor provides a thermal break to make the floor warmer and more comfortable, and so water vapor from the concrete floor does not condense or get trapped in the finished flooring. And since there is no organic materials, water will not affect it and mold will not grow on it.

The SaniDry™ XP Basement Air System makes your basement feel dry and smell dry!

The SaniDry Basement Air System is an important option for your finished basement. It filters the air and can effectively and efficiently reduce the relative humidity down to below 55%, and keep it there – so mold doesn't stand a chance!

A SaniDry™ XP Basement Air System installed in the unfinished area, ducting dry filtered air into a beautiful finished basement. (Shown with MillCreek flooring, available from your Basement Systems dealer.)

ABOUT

Total Basement Finishing is a sister company to Basement Systems Inc. Just as Basement Systems is the leader in basement waterproofing, TBF is the leader in basement finishing.

A basement finished by TBF has no drywall, wood, paint, or floor coverings to get ruined if they get wet or damp. Instead, our patented system uses cement board, a textured washable vinyl finish, plastic trim, foam insulation and flooring that can withstand wetting events without having to replace them.

It's because of this close relationship between companies that Basement Systems waterproofing dealers can offer many of TBF's products and benefits with the EverLast Finished Wall Restoration System. And, if it's time to finish or refinish an entire basement (right the first time) let us know – we're the experts!
